OUR FRAMES

Chick frames are strong, flexible and comfortable.

Thanks to the materials we choose. As well as acetate and metal, we use **TR90** which maintains its shape, withstanding knocks and bending.

It's ultra-lightweight and non-allergenic in contact with the skin. The flex hinge allows the temple to open up to 180 degrees: children can play safely and the glasses last longer.

Every one of our products has European CE and US FDA certification.

The models in TR90 are coloured both inside and out so, if the frames get scratched or if little ones pick at them, the colour doesn't change.

On the subject of colours, we let kids choose them for us. This is why every model in the TR90 range boasts up to 12 colour schemes, going from fairly standard shades, through two-tone and three-colour choices as well as vivid fluorescent shades.

We aim to make it easy for youngsters to put together the different parts of their eyewear, personalising it and making it fun to wear.

The hinges have been designed to make the fronts and temples **independent** and **interchangeable**. This allows opticians total freedom to help their customers and replace only damaged parts as required, providing immediate customer service with no delays.

The pads can also be widened or closed up to fit the nose of any child to perfection.

Instructions:

The material CHICK frames are made from is a different product from the “normal” acetate frames and the Grilamid (TR90) ones. This rubberised element allows resistance, lightness, stability, flexibility and unique comfortable fitting.

- It's recommended to take care on the maintenance of the frame which is hand painted, and in particular we recommend to pay strong attention when taking out and inserting the lenses, when adapting the length of the temples and when cleaning it. The frames are painted also inside the material (the double colours are painted all of the inside colour) with guarantee the durability of the frame also when it's scratched, but there is a hand made paint layer on the outside which could be damaged.
- The lenses should be removed and inserted by heating a little, not a lot like with acetate please, this prevent scratching of the paint from the inside part of the eye rim. We recommend also to insert the prescription lenses from the back side and not frontally if possible, basing on the deepness of the lens.
- If you need or not to reduce the length of the temple side and end tip please always re fix with some glue to prevent damage and movement from the use. Your lens suppliers and labs should know this but why not give this information also to external laboratories where you use for the lens fitting.
- The frames should be cleaned using first preferable plain water to remove all possible materials that may damage it, and then cleaned with proper cleaning microfiber cloth. Do not use alcohol products on the frame and please inform also the user. Finally we remind you that the flex can be replaced simply removing the 2 screws and that all the flex of our frames are the same, so you can easily solve any problem by using the frames you have in stock, fixing the customer's problem immediately and then asking us for the spare part needed.
- Company CHICK SNC do not accept to replace free of cost frames damaged due to non respect of this informations.

PATENTS

Our choices are driven by the concept of easy, sustainable, revolutionary design. To create perfectly fitting eyewear.

To the flexible temples we have applied a new patent: they are made of a combination of TR90 and metal making them very lightweight, flexible and, most importantly, they can be shortened up to 50%.

They can therefore be lengthened or shortened to match the proportions of the child's head with total accuracy for a carefree fit. This patented system together with a range of eye-sizes from 37 to 52 enables opticians to provide the perfect solution to any technical or aesthetic problems.

Other patents are being developed.

OUR SERVICE TO OPTICIANS

At Chick we work in close contact with opticians. Our products are designed to make it easy for them to solve those everyday eyewear problems and to guarantee uninterrupted, fast service. This is one of our top priorities.

The interchangeable parts and their long life enable opticians to do repairs immediately, including from the stocks in their own practice. Our well-stocked warehouse has **spare parts always available**, to guarantee a **turn-around time of 24/48 hours**.

ABOUT US

The **Chick** brand is very special, truly one of a kind that has been growing for over ten years alongside us and our kids.

After many years' experience in the Italian and international eyewear industry, we started Chick up in 2007, to make our dream come true and create eyewear full of fun and colour specially designed for the youngest spectacle wearers and to provide genuine solutions to the everyday problems of opticians and consumers.

Our values give us momentum and we will never stop our onward march, with products evolving and improving day on day. Our products are on sale in over 60 countries worldwide.
